PROJECT KICKOFF

Vultiagent

The agentic crypto wallet, powered by AI

APRIL 1, 2026 / INTERNAL

CURRENT STATE

What's Built Today

Five products sharing crypto logic, each at a different stage of maturity.

📱

Agent Wallet App

React Native (Expo 55) mobile app. Chat-driven wallet across 27 chain families. Functional, needs reliability work.

⌨️

MCP / CLI

Command-line tool + MCP server exposing wallet ops as structured tools. Any AI assistant can manage a Vultisig wallet.

🤖

Agent Backend

Go-based AI chat service. Interprets user intent via Claude, executes wallet ops. Needs SDK migration.

📦

Unified SDK Spike

Consolidating all chain logic into one TypeScript SDK. Key challenge: DKLS + wallet-core across all targets.

🌐

Station Wallet

Existing web wallet. Migrated to Expo 55 so the agent wallet app can be dropped in as its replacement.

⚠️

Core Challenge

Duplicated chain logic across codebases. ~10K lines reimplemented in the app alone. One SDK fixes this.

ROADMAP

12 Weeks, 3 Phases

From stabilization to autonomous agents that trade on your behalf.

PHASE 1 / WEEKS 1-4

Foundations

Unify all products on one SDK. Ship a fully functioning agentic wallet to Station.

PHASE 2 / WEEKS 5-8

Capabilities

Chrome extension. Opportunities engine. Staking, limit orders, advanced DeFi. Full M-of-N TSS signing.

PHASE 3 / WEEKS 9-12

Autonomous Agents

M-of-N signing done. Agents hold key shares, monitor markets, debate trades, and co-sign autonomously.

27 CHAINS

5 SURFACES

1 SHARED SDK

M-of-N TSS SIGNING

PHASE 1 / WEEKS 1-4

Foundations

Every surface running on one shared SDK with reliable core wallet operations.

- **Unify the SDK**, Consolidate all chain logic (EVM, Cosmos, Solana, Sui, TON, Tron, UTXO) into a single TypeScript package consumed by every product
- **Ship a fully functioning agentic wallet to Station**, Hype migration screen first, then core wallet ops (balances, sends, swaps, receives) working reliably on every chain. No burnt pizza: we only go live when it's ready
- **Add UTXO chains**, Bitcoin, Litecoin, Dogecoin, Bitcoin Cash via native wallet-core bindings
- **Begin Chrome extension**, chat UI shell, vault connection. SDK exposed via API/MCP rather than bundled, so updates propagate automatically without OTA releases
- **Accelerate TSS integration**, Groundwork already proved out. Begin implementing TSS flows in the agent app: multi-device relay coordination, session joining, timeout handling

PHASE 1 TIMELINE

Week-by-Week Milestones

WK 1-2	Begin Station migration + hype screen + core wallet audit · Stabilize MCP/CLI & agent backend · Start SDK unification (all chain logic) · Add UTXO chain support · Expand swap router coverage
WEEK 3	Ship Station agentic wallet (only when ready, no burnt pizza) · SDK unification substantially complete · Begin Chrome extension (SDK via API/MCP for OTA updates) · Begin TSS app integration (groundwork proved out)
WEEK 4	Expand SDK: token info, tx history, analytics · Polish all surfaces · TSS relay + session coordination in app

PHASE 2 / WEEKS 5-8

Capabilities & Surfaces

Differentiating features: browser extension, proactive opportunity detection, advanced DeFi, and multi-device TSS.

- **Chrome extension live**, Send, swap, chat with the AI agent directly from the browser toolbar
- **Opportunities engine**, Background monitoring for yield changes, price moves, and arbitrage. Pre-builds transactions, pushes notifications, user taps to approve
- **Staking support**, Cosmos validators, Solana stake accounts, ETH staking across all surfaces
- **Advanced DeFi**, LP positions, stop-loss, limit orders, TWAP execution, portfolio rebalancing, dust sweeping
- **Full MCP parity**, Every SDK capability exposed as an MCP tool. Third-party AI assistants can do everything
- **TSS to full M-of-N**, Complete threshold signing across all signer configurations (2-of-3, 3-of-5). Building on Phase 1 app integration

PHASE 2 TIMELINE

Week-by-Week Milestones

WEEK 5	Chrome extension functional (core ops) · Full MCP/CLI feature parity · TSS: multi-device key shares + relay
WEEK 6	Kick off opportunities engine · Begin staking/unstaking support · Extension polished & feature-complete
WEEK 7	Opportunities engine end-to-end · Advanced DeFi: LP, stop-loss, limit orders, TWAP · Staking shipped across all surfaces
WEEK 8	Stabilization & hardening week · Full M-of-N TSS signing functional · Opportunities engine reliability testing · All advanced SDK features stable or scoped down

PHASE 3 / WEEKS 9–12

Autonomous Agents

The wallet evolves from a tool you operate into a system that acts on your behalf, within user-defined guardrails.

- **Agents as TSS signers**, M-of-N signing landed in Phase 2. Now agents hold key shares and participate in signing sessions just like devices
- **Agent runtime**, Containerized AI agents as persistent processes. One-click hosted deploy or self-hosted via Docker Compose
- **Configurable guardrails**, Custom system prompts with enforced limits: max tx size, asset whitelists, daily spend caps, cool-down periods
- **Adversarial co-signing**, Two agents with different mandates must both approve. Growth vs. risk agent debate protocol
- **Logged reasoning**, Full audit trail of every debate, argument, and decision for user review and trust-building

PHASE 3 TIMELINE

Week-by-Week Milestones

WEEK 9	Agents join TSS signing sessions as vault members Agent runtime infrastructure (containerized instances)
WEEK 10	One-click hosted or self-hosted deployment User-configurable system prompts + guardrails
WEEK 11	Adversarial multi-agent signing Growth vs. risk agent debate protocol Full decision audit logging
WEEK 12	End-to-end autonomous flow Security hardening & failure recovery Demo-ready: agents detect, debate, sign, execute, notify

TEAM

How We're Organized

4 senior engineers, each with a primary domain (decision-maker) and a secondary (backup, stays across it). Everyone can commit anywhere.

📦

SDK Core

Chain logic, signing, types. The single source of truth all products build on.

🤖

Agent Backend

Go service, Claude integration, chat orchestration, MCP tool calls.

📱

Client Surfaces

Mobile app, Station wallet, Chrome extension. Every user-facing UI.

🔗

External Access

CLI + MCP server. How any 3rd party AI assistant manages a Vultisig wallet.

CADENCE

Delivery Rhythm

Lightweight coordination designed for speed. Automated visibility so engineers stay heads-down shipping.

- **2-week mission cycles**, work is shaped into goal-oriented missions with clear scope and timeboxes, assigned at the start of each cycle
- **Daily automated pulse**, a bot summarizes each engineer's git activity (PRs, branches, areas touched) and posts to Discord. Zero manual reporting
- **Weekly 30-min sync**, course corrections, architectural decisions, and blockers only. Not a status update
- **Self-test, self-merge**, CI enforces quality (lint, types, tests under 2 minutes). Engineers ship without waiting on reviews. Critical areas like signing and key material require pre-merge review
- **Lightweight mission tracking**, GitHub Issues for mission-level visibility and milestones. No heavyweight ticket management

COST & PRICING

How Much Does an AI Wallet Cost to Run?

We benchmarked 9 LLMs end-to-end to find the optimal cost/quality tradeoff, and a sustainable free tier.

COST & PRICING

How We Tested

End-to-end benchmarks against the real agent backend. No mocks, no simulations.

01
Live Infrastructure
Real agent backend, PostgreSQL, Redis, 66 live MCP tools. Each test creates a fresh conversation and hits the full AI pipeline.

02
9 Models via OpenRouter
Per-request model override. Same system prompt, same tools, same operations. Apples-to-apples comparison across providers.

03
13 Operation Types
6 core wallet ops (chat, balance, address, token search, send, swap) + 4 ambiguous prompts + 3 error recovery scenarios.

04
2–3 Reps Each
Every model × operation tested multiple times. 339 total API calls. Token usage, latency, and cost recorded in the DB automatically.

05
Multi-Turn & Caching
5-turn extended conversations to measure context accumulation cost. Cache detection tests to identify prompt caching opportunities.

06
Quality Assessment
Every response reviewed for: correct tool selection, graceful error handling, response formatting, and hallucinations.

COST & PRICING

Model Benchmarking: 9 LLMs Tested

339 API calls across 13 operation types. Real agent backend, 66 live MCP tools.

MODEL	COST/OP	LATENCY	SUCCESS	VERDICT
Gemini 2.5 Flash	$0.003	3.2s	100%	BEST VALUE
Claude Haiku 4.5	$0.029	5.7s	100%	BEST ANTHROPIC
Claude Sonnet 4	$0.134	6.8s	100%	PREMIUM ONLY
DeepSeek V3.2	$0.013	17.6s	100%	TOO SLOW
Llama 4 Maverick	$0.004	3.1s	97%	LEAKS SYNTAX
Claude Opus 4	$0.065	14.0s	100%	$20 IN 7MIN

Qwen3, MiniMax, Mistral omitted, too slow or no advantage over shortlisted models.

COST & PRICING

How the Routing Works

Three models, one routing layer. The model upgrades with the operation complexity.

Gemini Flash, $0.003/op
Chat, balances, sends, simple swaps, token lookups. ~70% of all traffic. Free & unlimited for everyone.

Claude Haiku, $0.03/op
Cross-chain swaps, staking, optimal routing. Premium ops on Free & Pro tiers. 100% success, 2 avg loops.

Claude Sonnet, $0.13/op
Stop-loss, TWAP, dust sweeping, autonomous agents. Premium ops on Power tier. Best tool-calling accuracy.

Cut Prompt Size 50%
82% of every request is fixed overhead. Trim system prompt + filter tools by intent. Halves all costs. Ships Phase 1.

Anthropic Prompt Caching
Direct API migration. System prompt prefix identical across all users,65% further reduction on Haiku/Sonnet. Ships Phase 2.

Swap Affiliate Revenue
0.3% on THORChain/DEX swaps → ~$1.50/active user/month. Covers 2× free tier cost. Revenue scales with usage.

LLM costs have dropped ~10× in 18 months. Architecture is model-agnostic, provider swaps are a config change.

COST & PRICING

Monthly Cost at Scale

Per-user costs with hybrid routing. Assumes 40 sessions/month, 5 turns/session.

	TODAY	HYBRID ROUTING	+ PROMPT CUT	TARGET STATE
Free cost/user	~~$22.31~~	$0.75	$0.40	$0.25
Pro $10 cost/user	~~$22.31~~	$4.00	$2.00	$1.30
Power $30 cost/user avg	~~$22.31~~	$25	$12.50	$8
Pro margin	–	2.5×	5×	7.7×
Power margin	–	1.2×	2.4×	3.75×

2.5× → 7.7×
PRO MARGIN JOURNEY

1.2× → 3.75×
POWER MARGIN JOURNEY

10×
LLM COST DROP / 18MO

COST & PRICING

What Users See

Unlimited basics. Premium ops metered. Nobody ever gets cut off.

FREE

Explorer

$0

25 premium ops/mo

Unlimited chat, balances, sends, simple swaps

Cross-chain swaps & staking (25/mo)

After quota: still works, lower quality

PRO

Active Trader

$10 /mo

100 premium ops/mo

Everything in Free

Cross-chain swaps, staking, optimal routing

After quota: graceful downgrade

POWER

Power User

$30 /mo

1,000 premium ops/mo

Everything in Pro

Stop-loss, TWAP, dust sweeping, autonomous agents

$0.10/op overage beyond 1,000

Power tier launches with 2–3 exclusive features (stop-loss, TWAP minimum). No tier launches without its value prop.

COST & PRICING

Path to Profitability

Base case: 10K users at 80% free / 15% Pro / 5% Power. Revenue vs. cost by optimization phase.

10K USERS (BASE CASE)	REVENUE	COST	NET MARGIN
Free 8,000 users	$0	$6,000	-$6,000
Pro 1,500 users	$15,000	$6,000	+$9,000
Power 500 users	$15,000	$12,500	+$2,500
Total (launch)	**$30,000**	**$24,500**	**+$5,500**
Total (post-optimization)	**$30,000**	**$10,500**	**+$19,500**

$5.5K
NET MARGIN / MO (LAUNCH)

$19.5K
NET MARGIN / MO (OPTIMIZED)

+ $1.50
AFFILIATE REV / ACTIVE USER

Profitable at launch with 10K users. Prompt trimming ships Phase 1, API caching Phase 2, Power tier reaches 3.75× margin by Phase 2. Affiliate revenue not included above.

COST & PRICING

How We Hit $150K MRR

Three scenarios by conversion rate. Affiliate revenue ($1.50/active swapper, ~30% of users) included.

PESSIMISTIC

81K

total users needed

90% Free	$0
8% Pro (6.5K)	$65K
2% Power (1.6K)	$49K
Affiliate (24K)	$36K

REALISTIC

43K

total users needed

80% Free	$0
15% Pro (6.5K)	$65K
5% Power (2.2K)	$65K
Affiliate (13K)	$20K

OPTIMISTIC

28K

total users needed

70% Free	$0
20% Pro (5.6K)	$56K
10% Power (2.8K)	$84K
Affiliate (8.4K)	$13K

Affiliate: 0.3% on swap volume, est. $1.50/active swapper/mo, ~30% of users swap monthly. Not dependent on subscription conversion.

BUSINESS MODEL

Revenue Beyond Subscriptions

Consumer subs are the floor. The MCP server turns Vulti Agent from an app into infrastructure.

REVENUE STREAM	PHASE	MODEL	YEAR 1 POTENTIAL
Consumer subs	1	Free / $10 Pro / $30 Power	$360K–$1.8M
Swap affiliate	1	0.3% on THORChain / DEX volume	Scales w/ users
API / MCP licensing	1	1K free calls/mo, $0.005–0.01/call. Tiers at $49/$199/$499	$500K–900K
Ecosystem grants	1	Chain grant programs (Sui, Base, Sei all active)	$500K–1M
Protocol partnerships	2	Default routing fees, featured placement	$60K–240K
White-label wallet	2	Per-active-wallet ($0.02/wallet/mo) + integration fees	$200K–500K
Enterprise DAO custody	3	Annual SaaS, $10K–50K/yr per org. AI-native multisig	$250K–500K

$1.5–3M
YEAR 1 DIVERSIFIED REVENUE

vasig/
B2B ASSET ALREADY BUILT

$25B+
DAO TREASURY TAM

Alchemy/Infura charge $49–999/mo for node access. Privy charges $0.01–0.05/wallet/mo for embedded wallets. Fireblocks charges $500–10K/mo for institutional MPC custody. Our stack covers all three layers.

GO TO MARKET

How We Get Users

Rename in-place like Trust Wallet and MyEtherWallet did. Let the product demo itself like ChatGPT did. Let engineers be the brand like Uniswap and Monad did.

GO TO MARKET

Station → Vulti Agent

Trust Wallet and MEW both renamed app listings in-place during rebrands, preserved ratings, downloads, and user base. We do the same.

NOW

- Hype screen in Station app,"Something is coming"
- Station X account teases rebrand,"We haven't forgotten you"
- In-app countdown banner with email capture

WEEK 2

- Thread from Vultisig founder on X: "We acquired Station because it had the user base and the app store presence. Now we're giving it an AI brain." Frames the rebrand as Station graduating, not dying
- App listing renamed: "Vulti Agent (formerly Station)"
- Give 15–20 mid-tier crypto influencers (10K–100K followers) early access, these creators actually use the product on camera, which consistently outperforms paid promotions

WEEK 3

- Ship the agentic wallet update to Station users
- Early Supporter attestation (on-chain badge) for first-week updaters
- "Formerly Station" in subtitle for 2–3 months, then drop

GO TO MARKET

The AI Demo Is the Marketing

ChatGPT grew because people shared screenshots of outputs. We have the same dynamic, nobody else has a natural language wallet. Every demo is marketing.

📱

Short-Form Demos

"I asked my wallet to swap ETH to USDC and it did it." Side-by-side: 8 clicks in MetaMask vs. 1 sentence in Vulti Agent.

🔒

MPC Security Narrative

"No seed phrase. Keys split across devices with threshold cryptography." Fireblocks built an $8B business on "institutional-grade MPC", we bring the same model to consumers.

🌐

Ecosystem Visibility

Vultisig already has WalletConnect integrations. Listing on DeFi Llama's wallet tracker and chain ecosystem pages (THORChain, Cosmos) puts us in front of users actively browsing for wallets, free, high-intent distribution.

🤖

AI × Crypto Positioning

AI agent platforms (Bittensor, CrewAI, etc.) need wallet infrastructure. Our MCP server lets any AI agent manage a wallet programmatically, positioning us as the default wallet layer for the fast-growing AI agent ecosystem.

BUILDER-LED MARKETING

Engineers Are the Brand

In crypto, technical depth signals legitimacy, polished marketing signals scam. Monad, Eigenlayer, and Uniswap all grew through engineers posting technical content. Our version for a 4-person team:

@vultisig: 1 Thread / Week

Every Friday, one "what we shipped this week" thread with screenshots or a demo clip. Owned by the community manager (see below), sourced from engineers. This single artifact does more than daily filler posts.

Engineers: Post When It's Interesting

No schedule, no quota. When you hit a cool bug, a nice before/after, or a wild edge case, post it. Tag @vultisig. Some weeks that's 3 posts, some weeks it's zero. Authenticity > consistency.

"Building @vultisig" in Bios

Vulti Agent is a sub-product of Vultisig, one brand, one audience. Every engineer's bio links to @vultisig, and a pinned tweet explains what Vulti Agent is. Every personal post passively drives discovery back to the product.

Quote-Tweet > Retweet

When @vultisig amplifies engineer posts, quote-tweet with added context ("our MPC engineer just shipped X"). Quote tweets get 2–3× the reach of plain retweets. This is the entire amplification playbook.

Who Runs @vultisig Day-to-Day

A dedicated community manager / marketing-ops hire. Writes the weekly ship thread, handles replies and DMs, quote-tweets engineer posts, manages Discord community. Engineers provide the raw material (screenshots, clips, technical context); the CM shapes and publishes it. This is a standalone role, not an engineer's side job. Budget: ~$3–5K/mo for a crypto-native CM (part-time or contractor). Can start Phase 1.

Quality over quantity. One substantive thread per week beats seven filler posts, crypto audiences are saturated with hype and actively filter it out.

GO TO MARKET

Where 10K Users Come From

The rebrand seeds the base. Three engines sustain growth after the buzz fades.

~40% / REBRAND CONVERSION

Station User Base

Existing Station users migrate via in-app update. Hype screen + early supporter badge drives urgency. App store listing renamed in-place—preserves ratings, downloads, and SEO. Trust Wallet and MEW both did this successfully during their rebrands.

This is the launch spike—not the growth engine.

~35% / AI AGENT ECOSYSTEM

Default Wallet for AI

Every AI agent that needs to transact on-chain becomes a distribution channel. The MCP server means Claude, GPT, and custom agents all funnel users to Vultisig wallets. Phantom became the default wallet for Solana dApps. We become the default wallet for AI agents. List on agent directories, partner with agent frameworks (CrewAI, LangChain, AutoGPT).

No competitor has this channel.

~25% / DEMO-DRIVEN ORGANIC

Product Sells Itself

"I asked my wallet to swap ETH to USDC"—screenshots and clips go viral the way early ChatGPT screenshots did. Target crypto media for the AI-native angle. SEO on emerging queries: "AI crypto wallet", "chat-driven DeFi". 15–20 mid-tier crypto influencers (10K–100K followers) with early access for authentic product demos.

Compounds with every new feature shipped.

Post-10K sustained channels: MCP ecosystem growth (every new AI agent = distribution), chain partnerships and co-marketing (newer L2s pay for wallet integrations), referral program with on-chain rewards, and SEO on AI+crypto queries as the category matures.

WEEK 12 END STATE

A wallet that thinks, debates, and acts on your behalf, secured by the same threshold cryptography that protects the keys themselves.

Mobile app. Browser extension. CLI/MCP. Proactive opportunities. Autonomous agents with adversarial co-signing. One SDK powering it all.
